Phase Shifters

Introduction

MDL hybrid phase shifters are generally used for high peak or average power experimental applications. They provide 360° of phase variation and are precisely adjustable and resettable.

MDL low-power dielectric phase shifters are available from WR28 through WR137 waveguide sizes, and are ideal as phase trimmers in monopulse applications. Their space-saving design also permits assembly of more variable phase shifters.

Hybrid Phase Shifters

The phase shift is approximately linear with dial rotation, but is not linear with frequency. As a result, calibration accuracy is limited to the particular frequency of the calibration. They can also be used in low power set-ups where ease of reset ability and compact physical configuration are desired.

These units maybe readily modified to meet customers' particular requirements. MDL hybrid phase shifters can be supplied pressure tight as well as with water cooling tubes for high average power.
